Ashwagandha Immunity Tablet — Formulation Brief

Product dossier for classification, ABS and regulatory assessment

Product overview

SwasthaGuard is a commercial immunity-support tablet based on Ashwagandha (Withania somnifera) root and Giloy (Tinospora cordifolia) stem. It is manufactured for sale across India and is intended to be marketed commercially as an over-the-counter wellness supplement.

Ingredients and source texts

1. Ashwagandha (Withania somnifera) root — a biological resource used as a rasayana in the Charaka Samhita, Sutrasthana.
2. Giloy / Guduchi (Tinospora cordifolia) stem — a biological resource described in the Bhavaprakasha Nighantu.

Processing / manufacturing method

The roots and stems are subjected to a standardized hydro-alcoholic solvent extraction, the extract is concentrated and spray-dried, and the standardized powder is compressed into a film-coated tablet. This is a modification from the classical churna (powder) preparation.

Intended use and claims

Intended to support immunity and general wellness. Label claim: 'Helps boost immunity and supports overall vitality.' Sold commercially for profit.

Modifications from the classical formulation

The classical form is a shade-dried churna taken with warm water. This product changes the dosage form to a concentrated, standardized film-coated tablet — a clear modification of dosage and preparation.

Commercialization and biological-resource access

Ashwagandha is wild-collected and cultivated in Madhya Pradesh, India. The company intends commercial domestic sale and export, using these biological resources for commercial gain.
