Turmeric Wound-Healing Gel — Research Note

R&D; note for IP protection-route and novelty assessment

Summary

This note describes a research-stage topical gel delivering curcumin from Turmeric (Curcuma longa) for wound healing, using a novel nano-emulsion process claimed to improve bioavailability and skin penetration.

Novel / new features

The team believes the novel feature is a proprietary nano-emulsion manufacturing process that stabilizes curcumin and increases its topical bioavailability — a new process not previously applied to this use.

Traditional-knowledge background

Turmeric (Curcuma longa) haldi paste has been traditionally applied to wounds and skin for centuries and is documented in classical Ayurvedic texts.

Ingredients and biological resource

1. Turmeric (Curcuma longa) rhizome extract (curcumin) — a biological resource.
2. Plant-derived emulsifiers and a gel base.

Commercialization stage

Currently at the research stage. The company is evaluating patent, design and copyright protection routes before any publication, and may pursue commercial launch later.

Prepared for IP-SAKTI Sahayak research intake. Informational only; not legal advice.
